Flame-resistant styrene-type resin compsn consists of (a) 100 pts wt of styrene-type resins, (b) 2-18 pts wt of ether derivatives of halogen-contg aromatic diols having wt average molecular wt of 500-10,000, (c) 2-16 pts wt of polyhalogenated diphenyl-alkanes of formula (I), (d) 1-10 pts wt of Si_2O_3 , and (e) 0.01-0.5 pts wt of polytetrafluoroethylene. The total amt of (b) and (c) is 12-21 pts wt. X = Br or Cl; l and m = integer 0-5 with the proviso that both of them are not 0; R = C_nH_{2n} (n = 1-10).

ADVANTAGE - The resin compsn has high flame resistance and well balanced heat resistance, impact resistance and fluidity.
